

For
Week Ending
January 16, 1971

U.S. DEPARTMENT OF HEALTH, EDUCATION, AND WELFARE / PUBLIC HEALTH SERVICE / HEALTH SERVICES AND MENTAL HEALTH ADMINISTRATION
DATE OF RELEASE: JANUARY 22, 1971 - ATLANTA, GEORGIA 30333

EPIDEMIOLOGIC NOTES AND REPORTS
FEBRILE UPPER RESPIRATORY DISEASE

Eastern Massachusetts

In the week ending Jan. 8, 1971, an outbreak of febrile upper respiratory disease began in the Boston area, with school absenteeism rising abruptly on Thursday, January 14, and still continuing. The illness is characterized by fever (temperature 101-103°F.) lasting approximately 48 hours, non-productive cough, headache, mild nasal congestion, backache, and malaise. Gastrointestinal complaints are generally absent. School absenteeism has ranged from 25 to 40 percent in 28 communities in the Boston area and as far west as Worcester, with more illness in high schools than in elementary schools; there has been little increase in industrial absenteeism. Several schools were closed Friday because of the outbreak, but most were open again Monday. No etiologic agent has been isolated; studies are in progress.

CONTENTS

Epidemiologic Notes and Reports	
Febrile Upper Respiratory Disease —	
Eastern Massachusetts	9
Surveillance Summary	
Aseptic Meningitis — United States, 1969	10

Respiratory illnesses in New York, Rhode Island, Connecticut, Vermont, and Maine show only the expected seasonal increase. Excessive school absenteeism in one small community in eastern New Hampshire has been reported.

There have been no reported outbreaks of influenza or influenza-like illness in the rest of the country.

(Reported by Nicholas J. Fiumara, M.D., Director, Division of Communicable Diseases, Massachusetts Department of Public Health; Vladas Kaupas, M.D., Director, Division of Communicable Disease Control, New Hampshire State Department of Health and Welfare; and the Respiratory Diseases Surveillance Unit, Viral Diseases Branch, Epidemiology Program, CDC.)

**SURVEILLANCE SUMMARY
ASEPTIC MENINGITIS - United States, 1969**

For 1969, 3,672 cases of aseptic meningitis were reported, representing a decrease from the 4,494 cases reported for 1968, but representing an increase over those annual totals reported for 1963 through 1967 (Table 1). There was a marked fluctuation in case reporting for many states, reflecting in some instances recognized major outbreaks. The seasonal distribution of aseptic meningitis from 1963 to 1967 showed a consistent pattern, with most cases occurring in late summer (Figure 1).

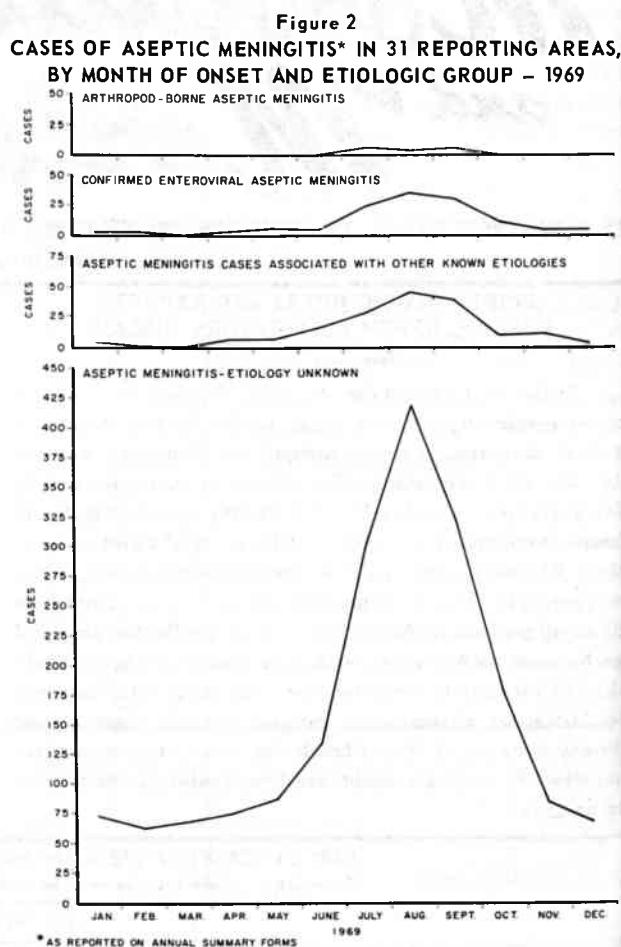

In addition to the weekly telegraphic reports sent to CDC by the states, 31 out of 53 reporting areas submitted a line listing of aseptic meningitis cases for 1969; a total of 2,598 cases, with 37 deaths, were reported.

Aseptic meningitis cases reported on annual summary listings were separated into four etiologic groups: non-polio enteroviral; arboviral; other known etiologies, including childhood infections; and unknown (Figure 2).

In 122 of the reported aseptic meningitis cases, recent infection with a non-polio enterovirus (Coxsackie virus or echovirus) was confirmed either by diagnostic serologic change or by virus isolation from cerebrospinal fluid (CSF). There were 18 different types of virus reported in association with these cases; no deaths were reported. In addition to the 122 cases associated with confirmed enteroviral infection, 172 cases were reported for which an enteroviral agent was isolated from stool or throat specimens, without accompanying serologic evidence of recent infection by the isolated agent. For many of these cases, no serologic testing was performed.

There were 12 reported cases, with no deaths, in which serologic evidence confirmed infection with California en-

(Continued on page 16)

*Mortality data are being collected from Las Vegas, Nev., for possible inclusion in this table; however, for statistical reasons, these data will be listed only and not included in the total, expected number, or cumulative total, until 5 years of data are collected.

ASEPTIC MENINGITIS - (Continued from page 10)

cephalitis virus; all of these were reported from Ohio. Cases were evenly distributed between the sexes, and all occurred in children under 10 years of age.

An additional 94 cases were reported for which an etiologic agent other than those noted above was found. Of these 94, 53 were associated with mumps infection, with almost twice as many cases occurring in males as in females; there were no deaths reported. Measles infection was associated with six aseptic meningitis cases. All six occurred in males from 5 to 14 years of age; no deaths were reported. Recent infection with Herpes simplex virus was related to 21 reported cases, with one death; the ages ranged from 5 to 59. Seven cases were associated with influenza infection, three with adenovirus infection, and one case each with infection with Mycoplasma, crypto-

coccus, and nocardia. The cases associated with the latter two were fatal.

For 2,194 of the 2,598 reported cases, no definite etiologic agent was found. No laboratory investigation was listed for many of these cases. Approximately 60 percent of the cases occurred in males. Although all age groups were represented, almost half of the cases and deaths were in children under 10.

(Reported by the Neurotropic Viral Diseases Unit, Viral Diseases Branch, Epidemiology Program, CDC.)

The Morbidity and Mortality Weekly Report, circulation 22,000, is published by the Center for Disease Control, Atlanta, Ga.

Director, Center for Disease Control
 Director, Epidemiology Program, CDC
 Editor, MMWR

David J. Sencer, M.D.
 Philip S. Brachman, M.D.
 Michael B. Gregg, M.D.

The data in this report are provisional, based on weekly telegraphs to CDC by state health departments. The reporting week concludes at close of business on Friday; compiled data on a national basis are officially released to the public on the succeeding Friday.

In addition to the established procedures for reporting morbidity and mortality, the editor welcomes accounts of interesting outbreaks for case investigations of current interest to health officials.
